

ABSTRACT

Drugs of abuse test strips are retained on the underside of a closure cap for a fluid sample container. Each strip has a bottom end defining a sample receiving portion and an indicator spaced longitudinally therefrom to visually indicate the presence of a selected drug of abuse. The closure cap is formed to seal the container, and the test strips are arranged so that when the container has a predetermined amount of fluid sample, it can be tilted until the fluid sample contacts the sample receiving portions of the test strips.
